file-sensitive-data: one file, three jobs

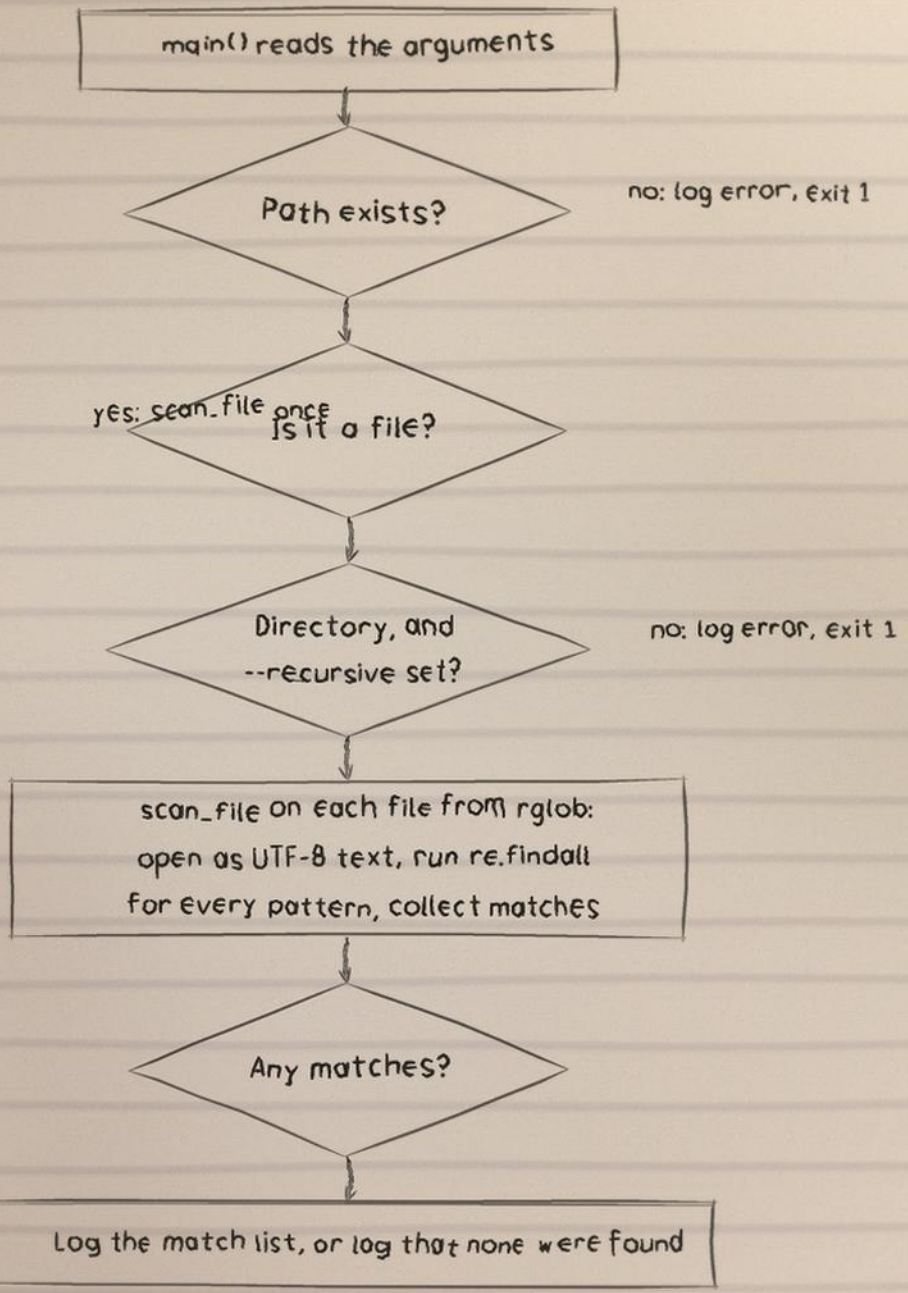

Default patterns: SSN NNN-NN-NNNN, and Visa style numbers starting with 4 (13 or 16 digits).

Standard library only: re, logging, pathlib, argparse, sys. No report file is written.

file tag, signed OK

One run, followed as decisions

A read error inside scan_file logs the error and returns an empty list.

Product map: what this scanner is for

GK

WHO IT SERVES

Me, checking a file or a folder before I share it, and anyone doing the same first pass by hand.

OUTPUTS

Log lines only. A found line lists the matches. A clean file gets a no matches line.

capabilities: two default patterns, custom regex override, single file scan, recursive tree scan

FILE-SENSITIVE-DATA

a small stdlib scanner for numbers that look private

INPUTS

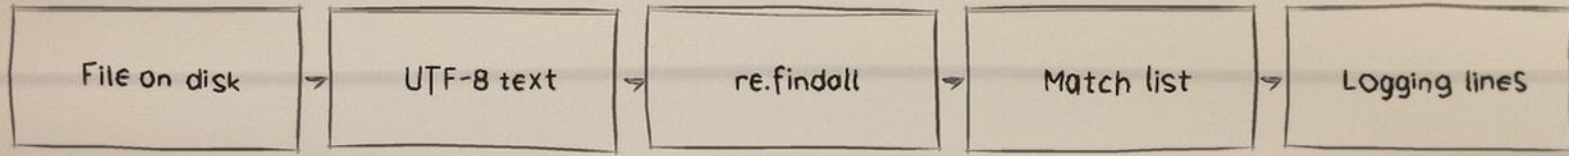

One file path, or one directory path with --recursive. Optional --patterns regexes.

BOUNDARIES

Pattern matching only. No other card issuers, no spaced numbers, no encoded data, no fixes.

Data flow inside scan_file

Text goes in one end. A list of matched strings comes out the other. Nothing is written to disk.

Custom --patterns replace both defaults at once. There is no merge and no extra output file.

checked OK

file-sensitive-data in numbers, counted 2026-10-30

Lines by kind, from git ls-files and a line count over each tracked text file.

The whole repo is 5 files and 6 commits. First commit 2025-01-02, last one 2026-10-30, both from git log.
Tests: no test files and no test suite in this repo, so no pass is claimed. I smoke ran the CLI instead.
Full table with the counting method for every number: VISUAL.md in this folder.
